

"Energy Saving Products."

Garage products can help reduce your energy bill

What can you do to reduce your energy bill as fuel cost continues to rise? Here are a few products we offer, plus a few helpful tips.

Products for your garage:

You might not immediately consider making your garage more energy efficient, but believe it or not a hot garage heats up your house during the hot summer months, and on the flip side a cold garage can cause your home to use more energy too.

The **Radiant Insulation for Garage Doors** is inexpensive and easy to install yourself. This product attaches to the garage door with a high temperature double sided tape. The garage door insulation wrap reflects 97% of the radiant heat coming in from the door, keeping your garage up to 20 degrees cooler in the summer, and keeping it warmer in the winter. With the added insulation the garage will have improved temperature

regulation thus lowering the energy consumption of the home.

To finish off your garage door, you can install the **Garage Door Threshold Kit**. This kit easily installs to the garage floor where the door comes down to meet the concrete. The threshold kit creates a tight seal keeping the outside elements such as water, debris, and pest out of your garage. This tight seal helps keep cooler air trapped in the summer, and warmer air in the winter in your garage when used with other insulation products.

Cooling your garage with the **Garage Fan and Attic Cooler** – install it yourself, and saves energy. The unit moves the hot air out of the garage and into the attic through a fan mounted in the garage ceiling. The GF-14 Fan brings in cooler air through the bottom front (door intake grills) of the garage blowing up the hot air into the attic pushing this super heated air out the existing attic vents. By doing so, the GF-14 will

help cool the garage up to 20 degrees and the attic up to 40 degrees and may lower the air conditioner load, reducing your energy consumption.
